The publication is great and fantastic. I am quite late in start reading this one, but better then never. I discovered this pdf from my dad and i suggested this ebook to discover.

Not illustrated. 1904 Excerpt: . a constant depending on the torsion control and winding of the instrument, and must be determined experimentally for the dynamometer. 175. Determination of the Constant of the Dynamometer.--To determine the constant K, we must send a known current through the instrument, and find the angle of torsion f , required to bring the suspended coil back to zero. The current may be measured by means of a current balance, standard galvanometer, or voltmeter. The dynamometer, after having been levelled as described, is connected in series with a variable resistance, secondary battery, voltmeter, and break-circuit key. The current is first adjusted until the deflection of the torsion head required to produce equilibrium is pretty large, the instrument being much more sensitive at high than at low readings, since the squares of the readings increase less rapidly at high than at low values. The voltmeter plates are then removed, and after being prepared as described previously, (par. 165), are weighed, and replaced in the voltmeter; the electrolysis should be allowed to go on for about one hour, the current being kept constant by means of the variable resistance. The current C is calculated from the gain in weight of the cathode, and then the constant calculated, since $K = \frac{C}{f}$, f being the angle of torsion as read off on the dial. Two or three such determinations may be made at various parts of the scale, and the mean of the values thus obtained taken as the constant of the instrument....
