The piston, 8, is formed with shallow channels on its outer surface to retain oil which prevents leakage and lubricates the piston. The socket in the center of the piston is supported by a central web and projects both upward and downward. The upper portion is threaded inside to receive the lower end of the pistonrod. It has a vertical slot which allows the ball bearing on the end of the spring to drop into a concave bearing on the upper end of the piston-screw, 9, which is screwed into the lower part of the socket. The piston-rod, 10, is made hollow, with the lower end threaded. When the piston-rod is connected to the socket, the former should be screwed into the socket as far as it will go. The height of the atmospheric line on the diagram depends upon the amount the swivel head, 11, is screwed into the top of the piston-rod. A small projection on the lower side of this cap is threaded to screw into the top of the spring and hold it firmly in place. The moving parts are kept in line by this cap. The pencil mechanism is supported by the sleeve 3, which surrounds the upper part of the cylinder; it turns freely and is held in position by the cap. The pencil mechanism is made as light as is consistent with strength and stiffness. The pencil moves exactly parallel to the piston because...
